# *GoogleEarth* Guide

Using *GoogleEarth* you can make maps of real bypasses to measure, or make bypasses for towns and villages that do not have one.

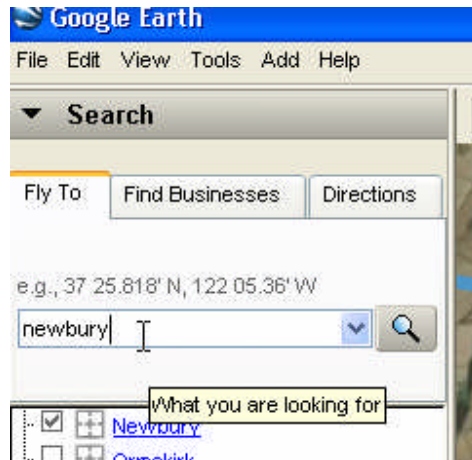

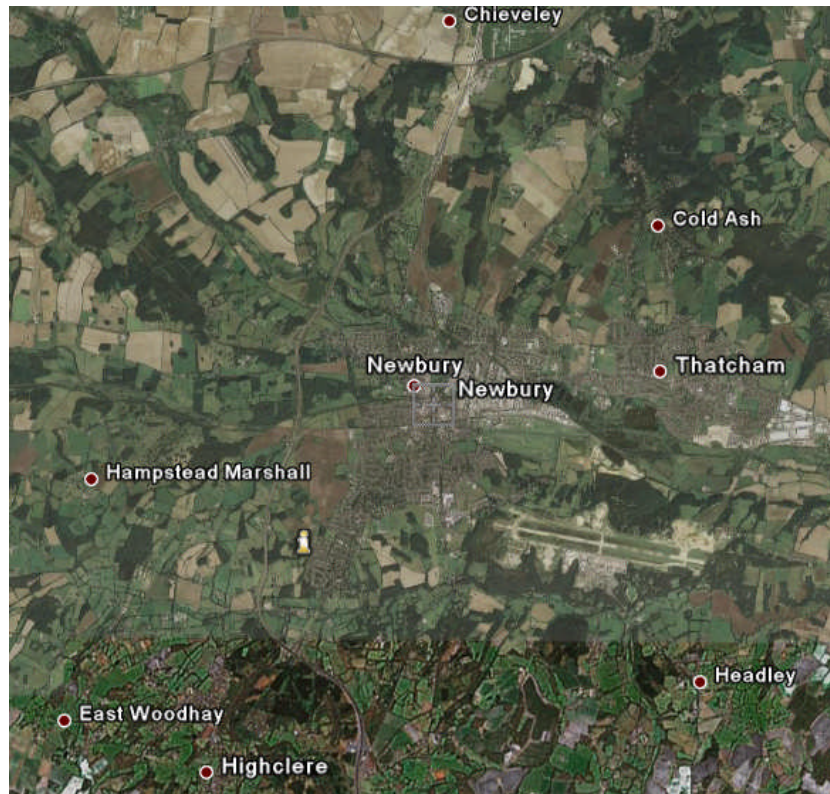

1. Start *GoogleEarth*

2. Type the name of a town or village
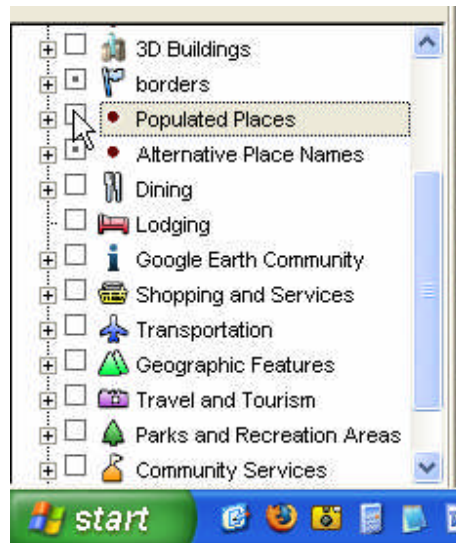

"Newbury" has been entered in this example.

3. Press enter

*GoogleEarth* will zoom in on the place you entered.

4. Deselect "Populated places"
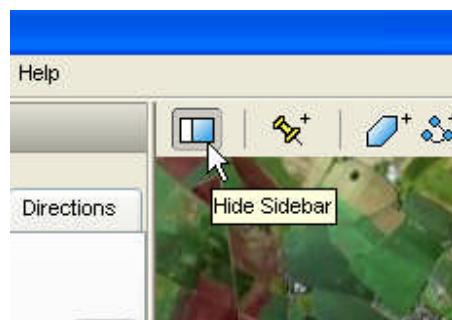

This makes the screen look less cluttered.

5. Select "Roads"

This makes the roads easier to see.
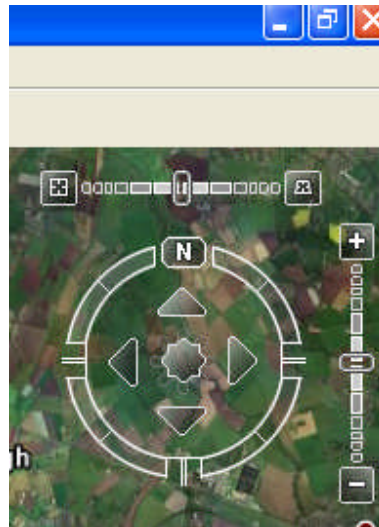

**6. Hide the side bar**

This makes the view go to fullscreen.

7. Use the navigation tools

The navigation tools are in the top right part of the map. Use them to move around and zoom in and out until you are happy with your view.
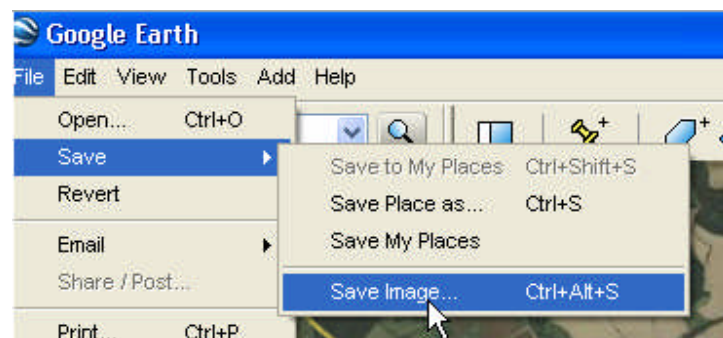

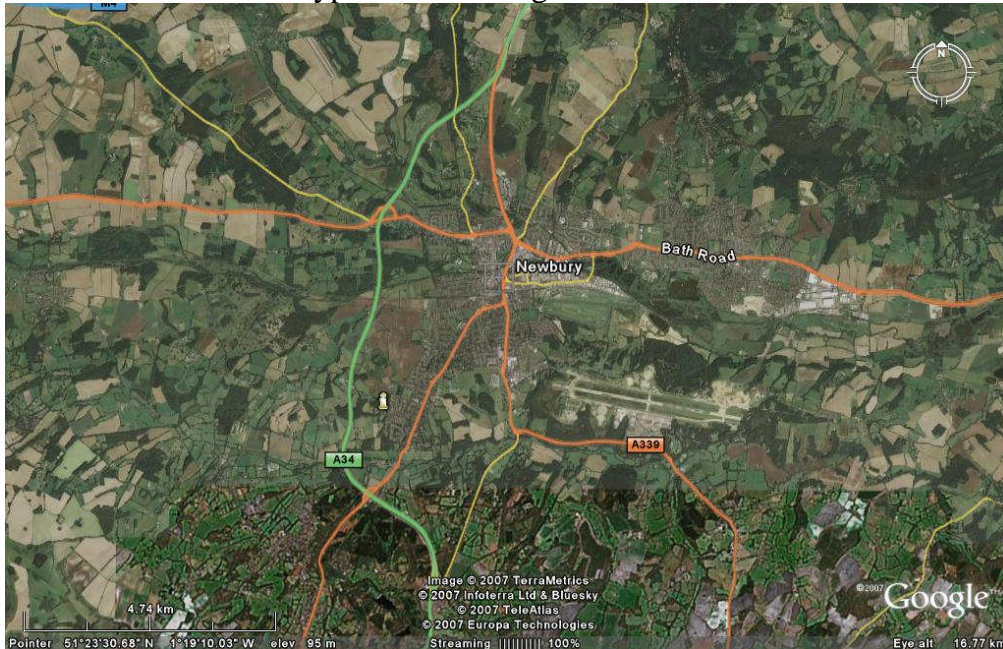

8. Copy or save your image

To **copy**, go to Edit then Copy then Copy Image…
…you can then paste your image into other programmes such as *Word* or *ByPass*.

To **save**, go to File then Save then Save Image…
… choose a sensible filename and remember where you save the image.

You now have a map ready for working in the ByPass software. Can you tell which road is the bypass in the image below?

You can also make maps of towns with no bypass and use the ByPass software to make one (the blue line in the example below).
